How to Perform a Self Breast Exam

Performing a self breast exam correctly involves a systematic approach to thoroughly check all breast tissue. A self breast exam pamphlet free typically outlines a step-by-step guide to ensure accuracy and consistency. Following these instructions helps individuals conduct exams confidently and effectively, increasing the likelihood of detecting abnormalities early.

Step-by-Step Guide

The following steps summarize the self breast exam process as commonly detailed in pamphlets:

1. **Visual Inspection:** Stand in front of a mirror with shoulders straight and arms on hips. Look for changes in size, shape, or skin texture, including dimpling or puckering.
2. **Raise Arms:** Raise arms overhead and observe the breasts for the same changes noted during visual inspection.
3. **Check for Discharge:** Gently squeeze the nipples to check for any unusual discharge.
4. **Palpation While Lying Down:** Lie down and use the pads of the fingers to feel the entire breast and armpit area in a circular motion, applying different pressure levels to examine both superficial and deeper tissues.
5. **Palpation While Standing or Sitting:** Many prefer to do this step in the shower, as wet skin makes it easier to feel changes. Use the same circular motion to examine the breasts thoroughly.

Key Areas to Examine

During a self breast exam, attention should be given to the entire breast area, including:

- Breast tissue from the collarbone to the top of the abdomen
- From the armpit to the cleavage area
- The nipple and areola for any changes or lumps

Covering these areas ensures a comprehensive check and increases the chance of detecting abnormalities early. Consistency in performing the exam monthly, preferably a few days after the menstrual period ends, is recommended for premenopausal individuals.
