Wiring Components of the SKR Mini E3 V3

A successful wiring setup is crucial for the effective operation of your 3D printer. Below are the main components you will encounter in the wiring diagram of the SKR Mini E3 V3.

1. Power Supply

- The SKR Mini E3 V3 requires a 12V or 24V power supply. Ensure that the

power supply is compatible with your printer's specifications.

- The power supply should be connected to the board's power input terminals, which are typically labeled as V_IN and GND.

2. Stepper Motors

- Stepper motors are responsible for the movement of the printer's axes. Each motor must be wired correctly to the respective motor driver on the board.
- The wiring typically follows this configuration:
 - X-axis motor
 - Y-axis motor
 - Z-axis motor
 - E1 or E2 (for dual extruder setups)

3. Endstops

- Endstops are crucial for determining the position of the print head and preventing it from moving beyond its designated range.
- Each axis (X, Y, Z) will have an associated endstop, and these should be wired to the designated pins on the board.

4. Thermistors

- Thermistors are temperature sensors used to monitor the temperature of the hotend and heated bed.
- Ensure that the thermistors are connected to the correct terminals marked for this purpose to avoid temperature reading errors.

5. Fans

- Cooling fans are essential for maintaining the temperature of the stepper drivers and cooling the printed material.
- The SKR Mini E3 V3 typically has dedicated connectors for part cooling fans and board cooling fans.

Creating the Wiring Diagram
