Core Concepts and Theories

The 14th edition of Social Psychology highlights several core concepts and theories that are essential to understanding the field.

1. The Social Self

The social self refers to the idea that individuals develop their identities based on social interactions. This concept emphasizes the importance of social context in shaping self-perception and behavior. Key theories include:

- **Self-Concept:** The beliefs a person holds about themselves, influenced by social feedback.
- **Social Comparison Theory:** The process of evaluating oneself against others to form judgments about personal abilities and worth.

2. Cognitive Dissonance Theory

This theory posits that individuals experience discomfort when they hold conflicting beliefs or when their actions contradict their beliefs. To alleviate this discomfort, they may change their attitudes or rationalize their behavior. This concept is crucial for understanding attitude change and personal justification.

3. Social Identity Theory

Developed by Henri Tajfel and John Turner, this theory explains how individuals categorize themselves and others into groups. It highlights the importance of group membership in shaping self-esteem and social behavior, leading to in-group favoritism and out-group discrimination.

4. The Bystander Effect

This phenomenon occurs when individuals are less likely to help a victim when other people are present. It suggests that the presence of others can create a diffusion of responsibility, influencing decision-making in emergency situations.
