Overview of the STERIS V120 Sterilizer

The STERIS V120 sterilizer is a state-of-the-art low-temperature sterilization system designed for delicate medical instruments and devices sensitive to heat and moisture. Utilizing vaporized hydrogen peroxide technology, it achieves rapid and effective sterilization with minimal environmental impact. The sterilizer's compact design and user-friendly interface make it suitable for various healthcare settings such as hospitals, clinics, and dental offices. The **steris v120 sterilizer service manual** provides an in-depth explanation of the unit's components, including the sterilization chamber, vaporizer, control panel, and filtration system. This knowledge is fundamental for service technicians to perform accurate maintenance and repairs.

Key Components and Functions

The sterilizer comprises several critical components that work together to ensure sterilization efficacy. These include the sterilization chamber where instruments are placed, the vaporizer that converts liquid hydrogen peroxide into vapor, sensors that monitor pressure and temperature, and the control system that manages the sterilization cycle. Understanding these components helps technicians identify potential points of failure and maintain the device optimally.

Operational Principles

The sterilization process involves several phases: preconditioning, sterilization, and aeration. During preconditioning, the chamber is evacuated to remove air and prepare the environment. The vaporized hydrogen peroxide is then introduced to eliminate microorganisms. Finally, the aeration phase removes residual vapor to ensure instruments are safe for handling. The manual details these stages to ensure correct operation and cycle validation.
