UNDERSTANDING THE UNIT CIRCLE

THE UNIT CIRCLE IS A CIRCLE CENTERED AT THE ORIGIN $(0,0)$ IN THE COORDINATE PLANE WITH A RADIUS OF EXACTLY ONE UNIT. THIS SIMPLE YET POWERFUL GEOMETRIC FIGURE FORMS THE FOUNDATION FOR DEFINING TRIGONOMETRIC FUNCTIONS FOR ALL REAL NUMBERS. IN ALGEBRA 2, THE UNIT CIRCLE IS USED TO EXTEND THE DEFINITION OF SINE, COSINE, AND TANGENT BEYOND RIGHT TRIANGLES TO ANY ANGLE.

EACH POINT ON THE UNIT CIRCLE CORRESPONDS TO AN ANGLE MEASURED FROM THE POSITIVE X-AXIS, MOVING COUNTERCLOCKWISE FOR POSITIVE ANGLES AND CLOCKWISE FOR NEGATIVE ANGLES. THE COORDINATES OF ANY POINT ON THE UNIT CIRCLE ARE GIVEN BY $(\cos \theta, \sin \theta)$, WHERE θ REPRESENTS THE ANGLE IN RADIANS OR DEGREES.

KEY PROPERTIES OF THE UNIT CIRCLE INCLUDE:

- THE RADIUS IS ALWAYS 1, WHICH SIMPLIFIES THE RELATIONSHIPS BETWEEN COORDINATES AND TRIGONOMETRIC VALUES.
- THE X-COORDINATE OF A POINT ON THE CIRCLE REPRESENTS THE COSINE OF THE ANGLE.
- THE Y-COORDINATE REPRESENTS THE SINE OF THE ANGLE.
- THE UNIT CIRCLE ALLOWS FOR THE DEFINITION OF TRIGONOMETRIC FUNCTIONS FOR ANGLES GREATER THAN 90° AND EVEN NEGATIVE ANGLES.

ANGLES AND RADIANS IN ALGEBRA 2

UNDERSTANDING ANGLES AND THEIR MEASUREMENTS IS CRUCIAL WHEN WORKING WITH THE UNIT CIRCLE IN ALGEBRA 2. ANGLES CAN BE MEASURED IN DEGREES OR RADIANS, AND BOTH SYSTEMS ARE USED EXTENSIVELY IN TRIGONOMETRY.

DEGREES

DEGREES DIVIDE A FULL ROTATION INTO 360 EQUAL PARTS. COMMON ANGLES LIKE 30° , 45° , 60° , 90° , AND 180° ARE OFTEN USED WHEN REFERENCING THE UNIT CIRCLE.

RADIANS

RADIANS PROVIDE A MORE NATURAL MEASURE BASED ON THE RADIUS OF THE CIRCLE. ONE RADIAN IS THE ANGLE SUBTENDED BY AN ARC EQUAL IN LENGTH TO THE RADIUS. THERE ARE 2π RADIANS IN A FULL CIRCLE, MAKING THE CONVERSION BETWEEN DEGREES AND RADIANS ESSENTIAL FOR ALGEBRA 2 STUDENTS.

THE CONVERSION FORMULAS ARE:

1. DEGREES TO RADIANS: $\text{RADIANS} = \text{DEGREES} \times (\pi / 180)$

2. RADIANS TO DEGREES: $\text{DEGREES} = \text{RADIANS} \times (180 / \pi)$

USING RADIANS SIMPLIFIES MANY TRIGONOMETRIC CALCULATIONS AND IS THE PREFERRED UNIT IN HIGHER MATHEMATICS AND CALCULUS.

TRIGONOMETRIC FUNCTIONS ON THE UNIT CIRCLE

THE UNIT CIRCLE PROVIDES A GEOMETRIC DEFINITION OF THE PRIMARY TRIGONOMETRIC FUNCTIONS: SINE, COSINE, AND TANGENT. THESE DEFINITIONS EXTEND BEYOND ACUTE ANGLES AND ALLOW FOR EVALUATION AT ANY ANGLE, POSITIVE OR NEGATIVE.

SINE AND COSINE

FOR AN ANGLE θ , THE POINT ON THE UNIT CIRCLE HAS COORDINATES $(\cos \theta, \sin \theta)$. THEREFORE,

- **$\cos \theta$** IS THE X-COORDINATE OF THE POINT.
- **$\sin \theta$** IS THE Y-COORDINATE OF THE POINT.

THIS RELATIONSHIP MEANS THE SINE AND COSINE FUNCTIONS ARE PERIODIC AND OSCILLATE BETWEEN -1 AND 1 .

TANGENT

THE TANGENT OF AN ANGLE IS DEFINED AS THE RATIO OF SINE TO COSINE:

$$\tan \theta = \sin \theta / \cos \theta$$

THIS FUNCTION IS UNDEFINED WHEN $\cos \theta = 0$, CORRESPONDING TO ANGLES WHERE THE UNIT CIRCLE CROSSES THE Y-AXIS (90° OR $\pi/2$ RADIANS, AND 270° OR $3\pi/2$ RADIANS).

OTHER TRIGONOMETRIC FUNCTIONS

ADDITIONAL FUNCTIONS SUCH AS COSECANT, SECANT, AND COTANGENT ARE RECIPROCAL OF SINE, COSINE, AND TANGENT RESPECTIVELY:

- $\csc \theta = 1 / \sin \theta$
- $\sec \theta = 1 / \cos \theta$
- $\cot \theta = 1 / \tan \theta = \cos \theta / \sin \theta$

THESE FUNCTIONS ALSO FIND THEIR VALUES BASED ON THE UNIT CIRCLE COORDINATES AND ARE IMPORTANT IN SOLVING MORE COMPLEX ALGEBRAIC AND TRIGONOMETRIC PROBLEMS.

USING THE UNIT CIRCLE TO SOLVE EQUATIONS

ONE OF THE PRIMARY APPLICATIONS OF THE UNIT CIRCLE IN ALGEBRA 2 IS SOLVING TRIGONOMETRIC EQUATIONS. THE UNIT CIRCLE PROVIDES EXACT VALUES OF SINE, COSINE, AND TANGENT AT COMMON ANGLES, ENABLING PRECISE SOLUTIONS RATHER THAN APPROXIMATIONS.

SOLVING BASIC TRIGONOMETRIC EQUATIONS

EQUATIONS SUCH AS $\sin \theta = 1/2$ OR $\cos \theta = -\sqrt{3}/2$ CAN BE SOLVED BY IDENTIFYING CORRESPONDING POINTS ON THE UNIT CIRCLE WHERE THESE VALUES OCCUR.

FOR EXAMPLE, $\sin \theta = 1/2$ CORRESPONDS TO ANGLES 30° ($\pi/6$ RADIANS) AND 150° ($5\pi/6$ RADIANS) WITHIN THE RANGE 0° TO 360° (0 TO 2π RADIANS).

GENERAL SOLUTIONS

SINCE TRIGONOMETRIC FUNCTIONS ARE PERIODIC, SOLUTIONS TO EQUATIONS OFTEN INCLUDE INFINITELY MANY ANGLES. THE UNIT CIRCLE HELPS DETERMINE THESE SOLUTIONS BY ACCOUNTING FOR PERIODICITY:

- FOR SINE AND COSINE, THE PERIOD IS 2π RADIANS.
- FOR TANGENT, THE PERIOD IS π RADIANS.

GENERAL SOLUTIONS CAN BE EXPRESSED AS:

- $\sin \theta = A$ $\Rightarrow \theta = \theta_0 + 2\pi k$ OR $\theta = \pi - \theta_0 + 2\pi k$
- $\cos \theta = A$ $\Rightarrow \theta = \pm \theta_0 + 2\pi k$
- $\tan \theta = A$ $\Rightarrow \theta = \theta_0 + \pi k$

WHERE θ_0 IS A REFERENCE ANGLE AND k IS ANY INTEGER.

GRAPHING TRIGONOMETRIC FUNCTIONS WITH THE UNIT CIRCLE

THE UNIT CIRCLE ALSO PLAYS A KEY ROLE IN GRAPHING SINE, COSINE, AND TANGENT FUNCTIONS IN ALGEBRA 2. UNDERSTANDING HOW THE COORDINATES CHANGE AS THE ANGLE θ INCREASES HELPS VISUALIZE THE WAVE-LIKE PATTERNS OF THESE FUNCTIONS.

GRAPH OF SINE AND COSINE

AS θ MOVES FROM 0 TO 2π RADIANS, THE SINE FUNCTION CORRESPONDS TO THE Y-COORDINATE OF THE POINT ON THE UNIT CIRCLE, PRODUCING A SMOOTH OSCILLATION BETWEEN -1 AND 1 . THE COSINE FUNCTION CORRESPONDS SIMILARLY TO THE X-COORDINATE.

KEY FEATURES OF THESE GRAPHS INCLUDE:

- AMPLITUDE OF 1 (MAXIMUM AND MINIMUM VALUES)
- PERIOD OF 2π RADIANS

- ZEROS AT SPECIFIC ANGLES WHERE THE FUNCTION CROSSES THE X-AXIS

GRAPH OF TANGENT

THE TANGENT GRAPH IS DERIVED FROM THE RATIO OF SINE OVER COSINE VALUES ON THE UNIT CIRCLE. IT HAS VERTICAL ASYMPTOTES WHERE COSINE IS ZERO, REFLECTING UNDEFINED VALUES. THE PERIODICITY IS π RADIANS, AND THE GRAPH DISPLAYS REPEATING PATTERNS OF INCREASING AND DECREASING VALUES.

BY CONNECTING THE UNIT CIRCLE COORDINATES TO THESE GRAPHS, STUDENTS GAIN A DEEPER UNDERSTANDING OF TRIGONOMETRIC BEHAVIOR AND FUNCTION TRANSFORMATIONS.

FREQUENTLY ASKED QUESTIONS

WHAT IS THE UNIT CIRCLE IN ALGEBRA 2?

THE UNIT CIRCLE IS A CIRCLE WITH A RADIUS OF 1 CENTERED AT THE ORIGIN (0,0) IN THE COORDINATE PLANE. IT IS USED IN ALGEBRA 2 TO DEFINE TRIGONOMETRIC FUNCTIONS FOR ALL REAL NUMBERS.

HOW DO YOU FIND COORDINATES OF POINTS ON THE UNIT CIRCLE?

COORDINATES OF POINTS ON THE UNIT CIRCLE CORRESPONDING TO AN ANGLE θ ARE GIVEN BY $(\cos \theta, \sin \theta)$, WHERE θ IS MEASURED IN RADIANS FROM THE POSITIVE X-AXIS.

WHY IS THE UNIT CIRCLE IMPORTANT FOR UNDERSTANDING TRIGONOMETRIC FUNCTIONS IN ALGEBRA 2?

THE UNIT CIRCLE ALLOWS US TO DEFINE SINE, COSINE, AND TANGENT FOR ALL ANGLES, INCLUDING THOSE GREATER THAN 360° OR LESS THAN 0° , EXTENDING TRIGONOMETRY BEYOND RIGHT TRIANGLES.

WHAT ARE THE COORDINATES OF COMMONLY USED ANGLES ON THE UNIT CIRCLE?

SOME COMMON ANGLES AND THEIR COORDINATES ARE: 0° (1,0), 90° (0,1), 180° (-1,0), 270° (0,-1), 45° ($\frac{\sqrt{2}}{2}$, $\frac{\sqrt{2}}{2}$), 30° ($\frac{\sqrt{3}}{2}$, $\frac{1}{2}$), AND 60° ($\frac{1}{2}$, $\frac{\sqrt{3}}{2}$).

HOW DO YOU USE THE UNIT CIRCLE TO FIND THE VALUE OF $\sin 150^\circ$?

FIRST, RECOGNIZE THAT 150° IS IN THE SECOND QUADRANT WHERE SINE IS POSITIVE. THE REFERENCE ANGLE IS 30° , AND $\sin 30^\circ = \frac{1}{2}$, SO $\sin 150^\circ = \frac{1}{2}$.

WHAT IS THE RELATIONSHIP BETWEEN THE UNIT CIRCLE AND THE PYTHAGOREAN IDENTITY?

SINCE THE RADIUS OF THE UNIT CIRCLE IS 1, ANY POINT (x,y) SATISFIES $x^2 + y^2 = 1$. THIS CORRESPONDS TO THE PYTHAGOREAN IDENTITY: $\cos^2 \theta + \sin^2 \theta = 1$.

HOW CAN THE UNIT CIRCLE BE USED TO GRAPH SINE AND COSINE FUNCTIONS?

BY MOVING AROUND THE UNIT CIRCLE AND PROJECTING THE Y-COORDINATE (FOR SINE) OR X-COORDINATE (FOR COSINE) ONTO A GRAPH, YOU CAN PLOT THE SINE AND COSINE FUNCTIONS OVER DIFFERENT ANGLES.
