Step-by-Step Guide to Programming Universal Robots

Programming a Universal Robot can be broken down into several key steps. Below is a simplified process for programming a UR cobot using the teach pendant.

Step 1: Powering On the Robot

- Ensure that all connections are secure.
- Power on the robot using the main switch.
- Wait for the robot to initialize and display the home screen on the teach pendant.

Step 2: Setting Up the Work Environment

- Clear the workspace around the robot to ensure safety.
- Set up any tools or fixtures that will be used with the robot.
- Define the work area and ensure that no obstacles are present.

Step 3: Creating a New Program

- Navigate to the 'Program' section on the teach pendant.
- Select 'New Program' and give it a name.
- Choose the appropriate robot model and tool configuration.

Step 4: Defining Tool and Coordinate Systems

- Set up the robot tool by specifying its dimensions and weight.
- Define the coordinate system for the robot's movements (e.g., Cartesian or joint space).

Step 5: Programming Movements

- Use the teach pendant to manually guide the robot's end effector to the desired positions.
- Record the positions by selecting the 'Add Position' option.
- Specify the type of movement (linear or joint) and the speed of the movement.

Step 6: Adding Commands and Logic

- Introduce other commands such as input/output signals, delays, or conditionals.
- Utilize the graphical programming interface to create loops or decision-making logic if required.

Step 7: Testing the Program

- Run the program in a simulation mode to check for errors.
- Conduct a dry run with the robot to observe its movements without any load.
- Make necessary adjustments based on the observations.

Step 8: Finalizing and Running the Program

- Once satisfied with the program, save it.
- Conduct a final check of safety measures.
- Run the program with the intended load and monitor performance.
